Fine Bent Grasses

A BENT STORY!

The wisdom of ages limited the buying power of the average public, therefore **LAWN GRASS SEED** is just a necessary evil expenditure to the garden variety public.

BUT—at least **"KNOW WHAT YOU SOW"** for your hard earned greenbacks.

Average cheap lawn mixtures, with over 5% Timothy hayseed, Ryegrass or Meadow fescue, will not make a velvety turf. Will only cover bare spots temporarily, grow fast and vanish quickly. Good blended lawn grass seed, grows slow—lasts long.

YOUR—pocketbook will decide the kind of lawn you get. The cheap mixtures are **also** good, but you have to reseed every year—so choose your weapons.

Although we sell cheap lawn mixtures as a measure of business competition, we only recommend the, better grades, higher priced, the ones with **BLUEGRASS, REDTOP** and **BENT** predominating, and then, work like

HELEN B. HAPPY and you'll get a **LAWN**.

"Why do I want a bent grass lawn?"

Answer: Because if I live in a region of acid soils bent is not only the most beautiful, but the easiest turf grass to produce and care for. If my soil is alkaline, because I want the best and am willing to go to a little extra trouble to get it.

Answer today to the same question: Because bent is the most beautiful of the turf grasses, is drought resistant, and will thrive anywhere except in the Far South, on either acid or alkaline soils, if the following simple instructions are followed:

Many of our friends write us:

"I have heard so much about creeping bent, why do you recommend Prince Edward Island Bent which is a non-creeper?"

Because the creeping varieties are somewhat better adapted to putting greens, which are cut and watered daily. Creeping Bent if neglected will form a tangled mass of surface growth instead of compact turf. Prince Edward Island bent produces its leaves near the base and spreads by underground root stocks instead of surface runners. Prince Edward Island Bent is essentially a dwarf grass and comes closer to the humorist's ideal of a lawn grass that grows three inches high and then stops than any other grass. Prince Edward Island Bent is native to dry soils and needs watering only in dry periods.

"But suppose I prefer creeping bent and can give it plenty of water and attention?"

Fine! Seaside Creeping Bent (*Agrostis palustris*, *A. maritima*) seed will produce a wonderful creeping bent lawn at very moderate cost and will require less water than vegetative strains. It requires a little more water and cutting than Prince Edward Island Bent.

"Will bent drive out weeds?"

Any well nourished grass will compete strongly with weeds. It is a fundamental law that two bodies cannot occupy the same space at the same time, so if well nourished grass occupies the entire lawn surface, weeds will

*When a fellow can't
do-what he wants to,
he is suppressed
(question) —*

*Can you afford
LAWN GRASS
of the better kind?*

have very little chance. From recent experiments it seems that most of our bad turf weeds are lovers of alkaline soils and that the acidity obtained from high nitrogen fertilizer which encourages bent discourages weeds.

"I have heard that bent lawns are very expensive. Are they?"

Vegetative or stolen planted lawns are expensive both from cost of stolons and labor standpoint. Bent seed costs no more to the square foot than good lawn mixtures, as the rate of seeding is much lower.

"Will Prince Edward Island Bent do well in shady or partially shady places?"

Prince Edward Island Bent will thrive in partially shaded places but you must be sure to use good fertilizer two or three times a year.

A FEW DO'S

Use good fertilizer.

Sow 2 pounds of Prince Edward Island Bent Seed to 1,000 square feet mixed with 4 or 5 times its volume of sand or humus.

Should large brown patch appear a little Semesan, obtained from any seedsman, will control.

Prince Edward Island Bent is virtually immune to small brown patch.

Golf clubs should add 5 to 10 per cent of Prince Edward Island Bent in their Fairway Mixture to be used on trees and approaches. It will only raise the cost of your mixture \$5.00 to \$6.00 an acre.

A FEW DON'TS

Don't expect Prince Edward Island Bent to penetrate a half inch of hard soil if covered too deeply.

Don't merely ask for bent seed. Ask for Certified Prince Edward Island, New Brunswick Creeping, Seaside Creeping or Certified Velvet Bent Seed.

Don't expect Prince Edward Island Bent to perform a miracle.

— But —

A little fertilizer + a little good soil + a little care in seeding = A LAWN OF PUTTING GREEN BEAUTY.

PROTECTION ON MIXED LAWN SEED

A record of over 55 years unvarying satisfaction in various climates and under stringent comparative tests, is the guarantee we offer with RADWAYS Lawn Grass Seed. Its reputation is your recommendation. Unequalled for quality, brilliancy and permanency.

RADWAY'S Lawn Grass Seed is now, always has been, and always will be the standard of Safety and Economy in seed buying.

Every bag of seed sold under the RADWAY label is the BEST possible to produce for the price paid.

Every bag of RADWAY Lawn Grass Seed carries the formula label—labeled for what it actually is and nothing else. You CAN'T make a mistake in buying RADWAYS Lawn Grass Seed.

You can have no better protection in seed buying than the RADWAY name and reputation extending over half a century of fair dealings.

Characteristics of Grass Seeds

Variety	Minimum Purity of Good Seed	Average Germ Year Old	Average Length Vitality Years	Weight Seed Legal Bush	Weight Seed Actual Bush	Yield of Seed Acre Lbs.	No. Seeds Average per Lb.

Lawn Grass Mixed.....	70	80	2	20	20-30		

Quantities of Grass Seeds and Stolons to Use

Disappointment traceable to too light seeding is quite frequent. At the same time, we do not recommend much heavier rates of seeding than those listed under "High" in the following table. Excessively generous seeding may be followed by patches of "die-back" in the resulting young turf, due to over-crowding of the plants.

QUANTITIES RECOMMENDED				Minimum	Average	High
(a) Golf Putting Greens						
Separate varieties { German Bent..... Per average green				40 lbs.	60 lbs.	75 lbs.
of Seeds { Chewing's New Zealand Fescue..... Per average green				75 lbs.	100 lbs.	125 lbs.
Mixtures { Special Putting-Green Bent Formula..... Per average green				75 lbs.	85 lbs.	100 lbs.
of Seeds { Standard Putting-Green Mixture..... Per average green				75 lbs.	85 lbs.	100 lbs.
Stolons. 1 square foot of nursery turf for 7 to 10 square feet to be planted.						
(b) Golf Fairways, Polo Fields, Football Gridirons, Diamonds, etc.				150 lbs.	200 lbs.	250 lbs.
Mixtures of Seeds. Per acre.....						
(c) "Rough" on the Golf Course..... 50 to 100 lbs. of seeds per acre...						
(d) Tees..... 1 pound of seeds per each 100 square feet....						
(e) Tennis-Courts						
Regulation size, 78 ft. by 36 ft. Seeds.....				15 lbs.	25 lbs.	30 lbs.
Full size, 130 ft. by 65 ft. Seeds.....				50 lbs.	75 lbs.	100 lbs.
Stolons. 1 square foot of nursery turf for each 7 to 10 square feet to be planted.						

Note.—Most of our grass seed mixtures weigh 25 pounds to the measured bushel. One pound of grass seed measures, approximately, 1½ quarts; one quart weights about ¾ pound.

Use one-quarter to one-half the above quantities when renovating existing turf.

Always leave as long a period as possible between preparing new land and sowing seed, or planting stolons, to give an opportunity for weeds to grow and be destroyed.

Well prepared soil, the finest possible seed, or stolons of an approved strain of Bent, are the essentials of good turf.

Turf from Creeping Bent Stolons

Why Use Stolons: The advantages of the vegetative method are that by it we get extreme uniformity of turf, both as to texture and color, and maximum freedom from weeds.

Soil Suitable for the Bents: All the Bents require a well-drained soil, naturally moist, friable, and rich; loams and clay loams are suitable; sand loams are suitable if enriched with rotted manure or mushroom soil; light soil and sands are generally unsuitable.

When to Plant Stolons: Fall is by far the best time. Small areas may be vegetated in the early spring, but it is not recommended that much work with stolons be undertaken after warm weather has set in.

Territory Suitable for the Bents. Generally speaking all the Bents may be grown successfully from the latitude of Washington, D. C., north to the limit of civilization.

A "stolon" or runner of Creeping Bent

(4) A "stolon" or runner of Creeping Bent is able to produce new plants at intervals throughout its length.

PRODUCING A FINE SWARD WITHOUT SEED BY THE VEGETATIVE METHOD

You May Sow Seeds, Too, if you wish. Many turf-producers plant stolons of Creeping Bent and, after covering them with soil, sow seeds of German Bent. If this is done a slightly finer turf is obtained. Use 10 square feet of Creeping Bent turf and ½ pound of German Bent seed to each 100 square feet.

An Important Point. Keep the stolons always slightly moist until you have planted and covered them with soil.

We offer two varieties of Creeping Bent: Washington Bent, and Metropolitan Bent, at \$25 per 100 sq. ft., \$225 per 1,000 sq. ft. (One square foot will furnish enough clipped stolons to plant 7 to 10 square feet.)

Speed with which a Turf may be Obtained: Little difference in time with which turf play be produced from stolons or seed.

We rank as one of the
LARGEST DEALERS IN LAWN SEED

CHARACTERISTIC ADAPTATIONS OF THE MORE IMPORTANT TURF GRASSES

Name of Grass		Time Required to Produce Good Turf	Adaptation of				Uses	Remarks
Scientific	Common		Wet or Dry Soils	Sandy or Clayey Soils	Acid Soils	Cold or Hot Weather		
Agrostis alba or Agrostis palustris or Agrostis stolonifera major	Redtop, marsh white southern, English bent or herd grass	One season	Adapted to wet and tolerant of dry soils	Adapted to clayey soils	Tolerant	Resistant to cold and fairly tolerant of heat	Fairways, greens and lawns	Sod forming habit of growth. Lasts about 1 year under close mowing. Used chiefly as a temporary grass.
Agrostis tenuis or Agrostis capillaris or Agrostis vulgaris	Rhode Island bent, Colonial bent, Brown top, "Golfalawn," "Astoria bent" and "P. E. I. bent"	One season	Adapted to both moist and dry soils	Adapted to clayey and sandy soils if well drained	Tolerant	Resistant to cold and fairly tolerant of heat	Greens, fairways and lawns	Probably used more extensively than any other seeded bent. German mixed bent contains about 75% of it. Sod forming habit of growth.
Agrostis Stolonifera Maritima	Creeping bent, Seaside bent and "Florin"	One season from seed 2 months from stolons	Adapted to moist soils	Adapted to clayey and tolerant of sandy soils	Very tolerant	Resistant to cold but not hot weather	Greens, lawns and fairways	German mixed bent contains about 2% of it. Seaside bent also called Agrostis maritima. Sod forming habit of growth.
Agrostis Canina	Velvet, dog brown bent	One season	Adapted to moist soils	Adapted to clayey soils	Very tolerant	Resistant to cold but not hot weather	Greens and lawns	Adapted to about same region as Kentucky blue grass. German mixed bent contains about 15% of it. Sod forming habit of growth.
Poa pratensis	Kentucky blue	Two seasons	Adapted to moist soils	Adapted to clayey soils	Tolerant if soil is rich and well drained	Resistant to cold but not hot weather	Fairways and lawns	Requires fertile soils and responds to lime treatments. Sod forming habit of growth. Will not stand close mowing.
Poa compressa	Canada blue	Two seasons	Tolerant of dry soils	Adapted to clayey soils		Resistant to cold and tolerant of hot weather	Fairways and roughs	Use only when soil is thin and poor. Does well on rocky or gravelly soils. Not as good as Kentucky blue or redtop on good soils.
Poa trivialis	Rough-stalk meadow grass or bird grass	Two seasons	Adapted to moist soils	Adapted to clayey soils	Tolerant if soil is rich and well drained	Resistant to cold but not hot weather	Fairways and lawns	Best of all grasses for shady lawns. Sod forming habit of growth.
Poa annua	Annual blue grass, spear grass or meadow grass	One season	Adapted to moist soils	Adapted to clayey soils	Tolerant	Resistant to cold but not hot weather	Greens, fairways and lawns	Sod forming habit of growth. The failure of this grass this past season resulted in poor and unplayable greens throughout country.
Festuca rubra	Red fescue	One season	Adapted to moist and tolerant of dry soils	Adapted to sandy loams and tolerant of clayey soils	Tolerant	Resistant to cold and fairly tolerant of heat	Greens fairways and lawns	2 commercial var. of red fescue are creeping r. fescue (F. rubra var. genuina) and New Zealand or Chewings' fescue (F. rubra var. fallax). One of the best grasses for shady lawns, sod. F. habit of growth.
Festuca ovina	Sheep's fescue		Very tolerant of dry soils	Adapted to sandy soils	Tolerant	Resistant to cold and tolerant of heat	Rough	Especially adapted to soils which are thin, sandy and rocky. Bunch forming habit of growth.
Festuca duriuscula	Hard Fescue		Very tolerant of dry soils	Adapted to sandy soils	Tolerant	Resistant to cold and tolerant of heat	Rough	Variety of sheep's fescue. Bunch forming habit of growth.
Festuca caillata or Festuca tenuifolia	Fine-leaved fescue		Tolerant of dry soils	Adapted to sandy soils	Tolerant	Resistant to cold and tolerant of heat	Lawns	Variety of sheep's fescue. Thrives well in shady lawns. Bunch forming habit of growth.

FACTS ON LAWN MANAGEMENT

By Permission of Professor L. S. Dickinson,
Mass. Agricultural College, Amherst, Mass.

(Extract)

SOIL—must be considered in three parts. No. 1 foundation (the earth below the sub soil); No. 2, the sub soil; No. 3, the top soil.

The sub soil is the reservoir from which the grass roots obtain water during periods between rain or artificial watering. It need not have any food value but must be of such physical character that it will retain enough moisture to supply the grass roots. Hard coat ashes six inches deep make an excellent sub soil.

The top soil is valued mainly for the organic matter it contains. Roll and rake soil, and then seed. After sowing, seed should be lightly covered by brushing or raking, and roll lightly.

Lawn mower should be set high, young grass should be well established before any attempt is made to clip it short.

All Bent seeds are very small. All Blue Grass seeds are small. All Fescue seeds are large. All Rye Grass seeds are very large.

Blue Grasses prefer alkaline (sweet) soil. Bents prefer acid (sour) soils. Fescues and Rye Grasses are not so particular.

Timothy is a hay seed very undesirable for lawn grass (used by seed dealers in conjunction with chaff Red Top to cheapen product and to act as filler, shows quick growth but ruins the lawn eventually).

NITROPHOSKA—15—30—15

Nitrophoska 15—30—15, contains 15% nitrogen, 30% phosphoric acid and 15% potash. This grade of Nitrophoska is universally suited for a variety of uses either alone or mixed with other materials.

Nitrophoska can be applied to turf either by spreading separately or by mixing with other materials such as compost, peatmoss.

Nitrophoska is used successfully on many golf courses. A number of the Clubs of the Metropolitan area purchased five or more tons and are using it for fairway and green feeding.

FLORANID (UREA).

Urea containing 46% nitrogen is a fertilizer in which the nitrogen is identical chemically with that in liquid manure. Urea is better than liquid manure, because it is dry, clean, odorless and very concentrated. One hundred pounds furnishes as much nitrogen as 225 pounds of Sulphate of Ammonia.

Urea over a period of five years has proven to be an ideal nitrogen fertilizer for fine turfs in all parts of the country. It gives vigorous rapid growth with excellent color in exceedingly short time. Urea is recommended by the Green Section of the United States Golf Association.

Now that the duty has been removed, it is one of the most economical fertilizers available for golf use.

It can be applied in water, in solution or it can be mixed with any other suitable material. We recommend from one to three pounds for each 1000 square feet of sod, applied at intervals throughout the season as needed. It is also used in conjunction with mercurial compounds for the prevention and treatment of fungus diseases.

FROM AMERICA'S LARGEST EVERGREEN NURSERY

Take advantage of the present popularity of Evergreens by offering collections of Evergreens. Varieties suitable for rock gardens, lawn planting and foundation planting. We will ship direct to your customers under your labels by parcel post prepaid anywhere in the U. S. A. We pay the postage. Copy and cuts for listing in your catalog will be furnished without charge.

Collections include all twice transplanted sizes 8 to 10 inches and 10 to 12 inches. Collections retail delivered to customer for \$4.25 to \$7.25.

EVERGREEN COLLECTIONS

Everyone wants Evergreen Trees. Their popularity has increased a hundred fold in recent years. Use them for rockeries, foundation or lawn planting, a whole collection for the usual price of one nursery specimen. These are all twice transplanted, sturdy trees (not seedlings) average age, 5 years. Three collections listed below, delivered by Parcel Post prepaid. Safe arrival guaranteed. Delivery March 15th to May 1st, July — November.

Lawn Grass booked for spring delivery at list prices. Markets are firm and may be higher. Send in your order now. Terms on our regular brands of mixed lawn seed: 60 days net; cash in 10 days, 1½% discount.

Lawn Grass and Certified Bent Seed are the most profitable items retail seed dealers can handle. Lawns seeded with Prince Edward Island Bent, wherever they have been fertilized and given moderate water and attention, have withstood drought conditions.

Prices quoted in both columns are for full unbroken bags STRAIGHT OR ASSORTED LOTS of seed.

Broken packages charged higher than single bags. Parcel Post shipments charged at broken package prices or higher.

Seamless Bags—with Seed 38c each. Grass Seed-Burlap Bags included gross for net.

Lawn Grass Burlap Bags free, net weight when unpacked. No Bags returnable at full price.

These quotations are for dealers only, F. O. B. New York and subject to change without notice. All orders filled at our best price on day received.
